Business Problem Statement

Business Overview

A growing retail company wants to Analyse customer purchasing behaviour to increase sales, improve customer satisfaction, and enhance retention. The company has observed changes in buying patterns across age groups, product categories, regions, and sales channels (online and offline).

Management aims to identify the key factors influencing purchase decisions — such as discounts, product reviews, seasonal demand, and payment methods — to improve marketing strategies and product performance.

🔹 Core Business Question

"How can customer transaction and behavioural data be used to identify trends, improve engagement, and optimize sales and marketing strategies?"

Project Deliverables

1️⃣ **Data Preparation (Python)**

- Clean and preprocess raw retail data.
- Handle missing values and create necessary features for analysis.

2️⃣ **Data Analysis (SQL)**

- Perform customer and product segmentation.
- Analyse repeat purchases and key sales drivers.

3️⃣ **Dashboard (Power BI)**

- Create an interactive dashboard showing revenue trends, customer insights, and channel performance.

4️⃣ **Report & Presentation**

- Summarize findings and provide actionable business recommendations.

5️⃣ **GitHub Repository**

- Upload Python scripts, SQL queries, Power BI files, and documentation in a structured format.
